Correspondence e-mail: hkfun@usm.my

Received 3 October 2011; accepted 4 October 2011

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.053;  $wR$  factor = 0.209; data-to-parameter ratio = 18.6.

In the title compound,  $\text{C}_8\text{H}_8\text{FN}_3\text{O}$ , the semicarbazide group is close to being planar, with a maximum deviation of 0.020 (1) Å, and subtends a dihedral angle of 16.63 (9)° with its attached fluorobenzene ring. In the crystal, molecules are linked by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds, forming layers lying parallel to the  $bc$  plane.

## (2*E*)-2-(4-Fluorobenzylidene)hydrazinecarboxamide

H.-K. Fun, T. S. Chia, S. Malladi, A. M. Isloor and K. N. Shivananda

### Comment

The semicarbazides, which are the raw material of semicarbazones, have been known to possess biological activities against many of the most common species of bacteria (Dogan *et al.*, 1999). Semicarbazones are of much interest due to their wide spectrum of antibacterial activities (Pandeya & Dimmock, 1993). Recently some workers have reviewed the bioactivity of semicarbazones and they have exhibited anticonvulsant (Pandeya *et al.*, 1998; Yogeeswari *et al.*, 2004) and antitubercular (Sriram *et al.*, 2004) properties. Accordingly and by considering the biological potential of semicarbazones, herein, we have synthesized the title compound to study its crystal structure.

The molecular structure of the title compound is shown in Fig. 1. The semicarbazone group (O1/N1–N3/C8) is essentially planar with maximum deviation of 0.020 (1) Å for atom N2. This plane makes dihedral angle of 16.63 (9)° with its terminal benzene ring (C1–C6). Bond lengths (Allen *et al.*, 1987) and angles are within normal ranges and are comparable to related structures (Fun *et al.*, 2009*a,b*).

In the crystal structure (Fig. 2), the molecules are interconnected by N3—H1N3···O1 and N2—H1N2···O1 hydrogen bonds (Table 1) forming two-dimensional networks parallel to *bc* plane.

### Experimental

Semicarbazide hydrochloride (0.86 g, 7.70 mmol) and freshly recrystallized sodium acetate (0.77 g, 9.40 mmol) were dissolved in water (10 ml) following a literature procedure (Furniss *et al.*, 1978). The reaction mixture was stirred at room temperature for 10 minutes. To this, 4-fluorobenzaldehyde (0.896 g, 7.23 mmol) was added and the mixture was shaken well. A little alcohol was added to dissolve the turbidity. The mixture was shaken for a further 10 minutes and allowed to stand. The title compound crystallizes out on standing for 6 h. The separated crystals were filtered, washed with cold water and recrystallized from ethanol to yield colourless needles. Yield: 0.98 g, 75.38%. *M.p.*: 506–508 K.

### Refinement

Atoms H1N2, H1N3 and H2N3 were located in a difference map and refined freely [N—H = 0.90 (2), 0.87 (2) and 0.91 (2) Å respectively]. The remaining H atoms were positioned geometrically [C—H = 0.93 Å] and refined using a riding model with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ .

### Figures

Fig. 1. The molecular structure of the title compound with atom labels with 50% probability displacement ellipsoids.

Fig. 2. The crystal packing of the title compound. The dashed lines represent the hydrogen bonds.

## (2E)-2-(4-Fluorobenzylidene)hydrazinecarboxamide

### Crystal data

$C_8H_8FN_3O$

$M_r = 181.17$

Monoclinic,  $P2_1/c$

Hall symbol: -P 2ybc

$a = 16.522$  (2) Å

$b = 4.4381$  (6) Å

$c = 11.9457$  (15) Å

$\beta = 103.478$  (3)°

$V = 851.80$  (19) Å<sup>3</sup>

$Z = 4$

$F(000) = 376$

$D_x = 1.413$  Mg m<sup>-3</sup>

Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å

Cell parameters from 2666 reflections

$\theta = 2.5$ – $29.4$ °

$\mu = 0.11$  mm<sup>-1</sup>

$T = 296$  K

Needle, colourless

$0.72 \times 0.18 \times 0.12$  mm

### Data collection

Bruker APEX DUO CCD  
diffractometer

Radiation source: fine-focus sealed tube  
graphite

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan  
(*SADABS*; Bruker, 2009)

$T_{\min} = 0.923$ ,  $T_{\max} = 0.987$

8746 measured reflections

2418 independent reflections

1657 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.024$

$\theta_{\max} = 29.9$ °,  $\theta_{\min} = 1.3$ °

$h = -23 \rightarrow 23$

$k = -6 \rightarrow 6$

$l = -16 \rightarrow 15$

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.053$

$wR(F^2) = 0.209$

$S = 1.00$

2418 reflections

130 parameters

0 restraints

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H atoms treated by a mixture of independent and constrained refinement

$w = 1/[\sigma^2(F_o^2) + (0.1446P)^2 + 0.0418P]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.31$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.21$  e Å<sup>-3</sup>

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
